No. 003 - Modern-Day Epicycle Desk

Space Does Not Expand Here

A hard boundary between One-Wave and standard cosmology, before borrowed equations quietly become doctrine.

The correction

One-Wave uses a static cosmic background. Redshift is assigned to propagation-energy transfer, not metric expansion. The energy lost by light must enter the field, travel through the return architecture, and reappear through White Energy ejection.

Forbidden inside canonical One-Wave math

scale factor $a(t)$
Hubble expansion $H(t)$
negative-pressure dark-energy target
space stretching wavelengths

The replacement

$$\frac{dE_{\gamma}}{dl} = -\kappa_{\gamma} E_{\gamma}$$
$$1+z = \exp\left(\int \kappa_{\gamma} dl\right)$$

The equation is only a Yellow transport scaffold. It must survive image-blurring, spectral-width, timing, and energy-accounting tests.

White Energy

The old dark-energy label is replaced by White Energy: quasar/white-hole-scale outward release and reinjection. It closes a circulation loop; it does not enlarge space.

Verdict: Expansion equations are not a harmless comparison inside One-Wave. They change the ontology. Any future node that imports them must be rejected or clearly isolated as Standard Model / standard-cosmology reference.
