

The One-Wave Times

Local Variable n Arrested for Identity Theft

The same letter was found impersonating coordinate index, word length, and dimensional route count.

SATIRE / NOT A PROOF NODE

Raid on the equation district

Inspectors discovered three copies of $2n+1$ operating under separate identities. One was the odd recursive alphabet rail. One counted ternary Arnoux-Rauzy factors. One was mirrored routes plus a center. They looked alike enough to fool a hurried summary.

KNOWN ALIASES

Alphabet: $2n+1$ is a coordinate rail.

Word theory: $p(n)=2n+1$ counts factors in a ternary strict word.

Geometry: $2N+1$ counts directed routes plus center.

same written form != same variable != same mechanism

Defense statement

The accused equations insisted they had never claimed to be identical. "People kept introducing us as cousins and then left the room," one expression said.

Actual correction: every variable and ratio must declare its domain. Structural resemblance is a candidate bridge to test, not permission to merge definitions.

Verdict: Charges against the equations were dropped. The explanation was remanded to D-411 for proper labeling.
