Book 4 — Scope and Status

Scope

Book 4 covers planetary and solar-system scale in B-220's hierarchy — one level up from Book 3, one level down from Book 5's galactic scale. This scale assignment is an inference from the size ladder, not yet separately confirmed.

HONEST STATUS

This book does not yet exist as chapters. What follows is a scope statement and a list of what would need to be built first — not a placeholder pretending otherwise, and not invented physics content to fill pages.

What Would Need to Exist First

This book leans almost entirely on G-715, a single Yellow function node that itself admits mainstream heliophysics hasn't solved the coronal heating problem either. Genuinely thin at the moment — closer to a research direction than a book's worth of material.

Candidate Chapter Topics (Unwritten)

CANDIDATE TOPIC	NEAREST GROUNDING	GAP
Planets as Bounded Persistent Modes	A-112, B-220	Direct application, largely untested at this scale
Stellar Boundary Reversal / Coronal Heating	G-715	Real published mainstream problem; own mechanism unsimulated
Magnetic Switchbacks as Mirror Events	G-715 (subfunction)	Same status as above
Planetary Formation	none	No supporting nodes exist at all
Orbital Dynamics	C-327–C-332 (relational acceleration, common-mode field cancellation, moving local potential perturbation, encounter	Bridge nodes now exist, but they are Gray-equivalent restatements of standard patched-conic mechanics by design (see G-735 Prediction-Difference Gate) — no solar-system simulation has been run against them (the backlog's Solar-System All-Body Differential

frame transform, gravity-assist energy transfer)	Simulation item remains MAPPED) and no G-734/G-737 validated result exists. Still not chapter-ready; the gap moved from “no supporting nodes” to “supporting nodes exist but are unvalidated.”
--	--

Updated after the relational-mechanics backlog pass: the Orbital Dynamics row above was corrected from “no supporting nodes exist at all” now that C-327–C-332 exist. See RELATIONAL_MECHANICS_NODE_BACKLOG.md at the repository root.

Why No Content Yet

The governing rule for this book series is that appendices define the language and books apply it — no book chapter should introduce a mechanism that doesn't already exist as a node. Writing chapters for this book before that grounding exists would mean inventing physics-analog content at the book layer, which breaks that rule and would not be honest to the framework's own discipline.
